

MAKE THE RIGHT CHOICE FOR
YOUR PATIENTS....

VITAMIN D

VERIFYING VITAMIN D LEVELS

Today a screening test for vitamin D levels is as simple as drawing blood from a patient. This is important to check because ;

Epidemiology studies indicate that 50% of adults in the U.S., regardless of their location have insufficient circulation of vitamin D. This leads to unfettered calcium, phosphate and PTH levels in an endocrine fashion and also possesses autocrine roles in peripheral tissues.

There are medical conditions associated with Vitamin D insufficiency which include osteoporosis, osteoarthritis, falls/neuromuscular function, multiple sclerosis, fibromyalgia-like syndrome, type 1 diabetes, insulin sensitivity, cardiovascular disease, periodontal disease, tuberculosis, hypertension and many more...

It's an orderable test at any of our local MEDLAB facilities, Medicare reimbursed and best of all, it's a screening test for your patients Vitamin D status.

Take this opportunity to improve the quality of medical care for your patients by calling our client solutions team for more details.
